FREE START GUIDE

AI Pet Video Starter Guide

A Beginner's Guide to Creating Your First AI Pet Video

Concepts · First Prompt · Step-by-Step Workflow · Checklist

FourFeetz Studios

November 2026 · English Edition · Brand-Independent Educational Material

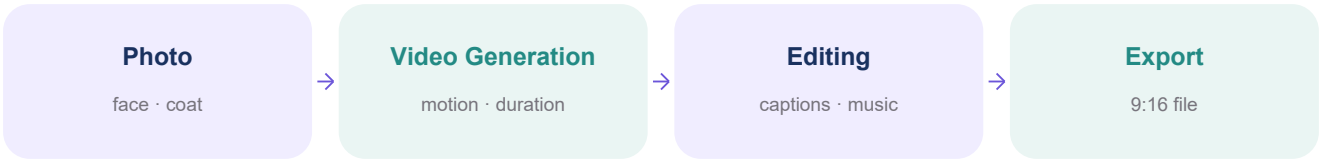

FREE 01 / GETTING STARTED

What You'll Learn

This short beginner guide explains how AI video is made and helps you generate your first clip yourself.

This guide is not a complete workbook that replaces the paid Starter Pack. Instead, it gives you the essential concepts and one prompt example so you can experience the production flow without making a separate purchase.

What You'll Make

What you need	Reason	Recommendation
One photo	Defines the main pet's face and coat	Use a photo you have permission to use
AI video generation tool	Turns a still image into movement	Choose a tool that supports Image-to-Video
Video editing tool	Trims clips and adds captions	Use one with a 9:16 canvas

Estimated Working Time

For a first attempt, allow about 30-60 minutes for planning and editing, excluding account setup, generation queues, and retries.

FREE 02 / CONCEPTS

Text-to-Video vs. Image-to-Video

If you want to preserve the appearance of a real pet, Image-to-Video is usually the clearest place to begin.

Method	What do you provide?	When should you use it?
Image-to-Video (I2V)	Reference photo + motion description	When you want to animate a real pet photo
Text-to-Video (T2V)	Written appearance, place, and action	When staging an imaginary animal character

Common Preparation

- Confirm image copyright, portrait rights, and the pet guardian's consent.
- Choose a high-resolution photo with a clear face.
- Results are not guaranteed and vary by model and source material.

Important

AI-generated scenes based on a real photo may not be actual footage. Explain this clearly to avoid misleading viewers, and check the commercial-use terms for every tool you use.

FREE 03 / STORY

Describe a 15-Second Video in One Sentence

For your first video, one animal, one place, and one action are enough.

0-3 sec
Who and where?

→

3-10 sec
One small action

→

10-15 sec
Finish with an expression

One-Sentence Plan Example

A cat sits on a cushion by the window, gently tilts its head, and looks toward the camera.

Common Mistakes

- Packing jumps, turns, and running into one clip.
- Asking the animal to exchange several objects in sequence.
- Changing locations repeatedly or adding fast camera movement.

A Good First-Video Result

Your first attempt is successful when the intended action is mostly clear and the face and paws are not severely distorted.

FREE 04 / PHOTO

Simple Guidelines for Choosing a Good Photo

Composition and clarity matter more than writing a long prompt.

Good	Avoid
Clear face, eyes, and ears	Face is very small or blurred
One main pet and a simple background	Several animals overlap

Good	Avoid
Framing similar to the desired output	Body or ears are heavily cropped
Natural lighting	Strong filters or harsh backlighting

Preparation Order

- Select one photo and keep the original file separately.
- Write down 2-3 features to preserve, such as coat pattern, round eyes, or a white collar.
- Choose a tool that supports reference-image upload.
- Check the service policy before uploading; files may be used for automated training depending on the service.

When Choosing a Photo

For a full-body running shot, avoid starting with an extreme face close-up. The model may invent a new body shape and increase distortion. Face-centered, small movements are safer for a first attempt.

FREE 05 / PROMPT

Enter Your First Prompt

Start in Image-to-Video mode with a reference image. Let the image define appearance while the text describes movement.

Free Beginner Prompt

The pet in the reference image sits comfortably. It slowly tilts its head once and looks toward the camera. The camera remains fixed at eye level, with natural lighting maintained. Keep the pet's face and coat color as consistent with the reference image as possible.

Easy Variations

- Dog to cat: describe from the reference photo rather than relying only on an animal label.
- Head tilt to one blink: replace just one core action.
- Fixed camera: the safest stabilizing choice for beginners.

Why Is It Written This Way?

The image already supplies appearance and background, so the prompt focuses on action and camera behavior instead of repeating visual details. Available settings and output quality differ by model.

FREE 06 / GENERATION

Six-Step Generation Workflow

Whichever tool you use, find the items below and work through them in order.

Step	What to do	Check
1	Open a new project or Video Generation	Confirm that you are in video mode
2	Select Image-to-Video and upload the photo	The photo appears as the first frame
3	Paste the example prompt	Only one action is requested
4	Select 9:16 and a short duration if supported	The options exist in your tool
5	Generate and check face / movement / camera	There is no severe distortion
6	Save the file and move to the editor	Confirm the file type and resolution

What the Settings Mean

9:16 is a vertical screen ratio. Duration, aspect ratio, output count, and resolution options vary by service, model, and plan.

FREE 07 / EDITING

Turn Your First Clip into a Short Video

If the generated clip is shorter than 15 seconds, combine it with a still image and a simple ending card.

0-2 sec
Photo / short intro

→

2-9 sec
Generated action clip

→

9-15 sec
Short ending card

Editing Steps

- Create a 9:16 vertical canvas in the editor.
- Arrange the source photo and generated clip in chronological order.
- Trim unnatural opening and ending frames.
- Add captions during editing rather than inside AI generation.
- Verify music and sound-effect usage rights and keep audio at a comfortable level.

- Preview the exported video full-screen on a phone.

Scope

A still image and ending card work well for a first project. Connecting several scenes with strict continuity is outside the scope of this beginner guide.

FREE 08 / CHECKLIST

Troubleshooting · Tips · Final Check

Fix the largest error first to reduce generation cost and repeated attempts.

Problem	First Fix
Face changes into another animal	Fix the camera, simplify movement, and reconsider the source photo
Paws or legs look unnatural	Use face-centered movement instead of full-body action
Background moves	Simplify the background instruction and keep the camera fixed
Generated text is broken	Remove text from generation and add it in the editor

Final Check

- Is the main subject visible in the first two seconds?
- Is there one clear action?
- Is there severe appearance distortion?
- Is the face safely inside the 9:16 frame?
- Have photo and music usage rights been checked?

Tip

When a result works, save the photo, prompt, and settings together. In the next video, change only the location or one action so differences are easier to compare.

Further Learning

The Starter Pack includes three reusable prompts in Korean and English, tool-specific starting settings, failure-and-fix examples, hands-on cases, and worksheets from beginning to end. It goes deeper into practical execution without repeating this free guide's basic explanations.
